Tips for Reducing Server Load

If you're monitoring your server load and find it's consistently higher than you'd like, there are a few simple steps you can take to reduce it.

1. **Compress CSS.** First, consider compressing your CSS. You can do this by utilizing shorthand properties or a CCS compressor program. It's also helpful to delete any unnecessary HTML, white space, and tags.

2. **Compress data.** Compressing your data is another way of reducing server load. Compression algorithms, like Brotli and Gzip, are highly recommended. These methods can rapidly shrink your web page size.

3. **Optimize images.** Optimizing your images is one of the best ways to reduce server load, because images often account for more than 50% of [bandwidth usage on a website](#). During the optimization process, replace images with CSS code wherever possible.

4. **Offload images.** Lastly, if your server load continues to be problematic, seriously consider hosting your images elsewhere, especially if your website is image-heavy. Websites like ImageShack and Flickr are viable options. If the image you want to include is already hosted elsewhere, you can link to its location instead of hosting a copy on your server.

Choosing the Right Server Load Monitoring Tools

The market for server load monitoring tools is vast. While some server load monitoring tools offer advanced utilities, they might not provide the range of capabilities you're looking for, or even a user-friendly experience. [SolarWinds Server & Application Monitor](#) is a consistent favorite among IT

The screenshot displays a web application for creating math quizzes. The interface is clean with a dark blue header. The main content area is white and contains a form for adding a new question. The question text is a word problem involving ages. There are three input fields for providing multiple-choice answers. The browser's address bar indicates the application is running on a local server.
